EDGE INTELLIGENCE ARCHITECTURE FOR SMART CITY APPLICATIONS: A REVIEW PAPER

Aadarsh Joshi¹, Madhuri Gupta²

ABSTRACT

The rapid growth of urbanization and the increasing deployment of Internet of Things (IoT) devices have transformed traditional cities into smart cities. Smart city applications generate enormous amounts of data from sensors, cameras, connected vehicles, healthcare systems, energy grids, and intelligent transportation systems. Traditional cloud computing architectures face challenges such as high latency, bandwidth limitations, security concerns, and scalability issues. Edge Intelligence (EI) integrates Artificial Intelligence (AI) with edge computing to process data closer to the data source, enabling real-time decision-making and efficient resource utilization. This review paper presents a comprehensive study of Edge Intelligence architecture for smart city applications. The paper discusses the architecture, components, enabling technologies, applications, benefits, challenges, and future research directions of EI in smart cities.

1. INTRODUCTION

Smart cities aim to improve the quality of life of citizens through the integration of digital technologies, communication networks, and intelligent systems. Technologies such as IoT, cloud computing, Artificial Intelligence (AI), Machine Learning (ML), and big data analytics play a crucial role in smart city development.

Traditional cloud-based systems process data in centralized data centers, which introduces delays and network congestion. Many smart city services such as traffic management, healthcare monitoring, emergency response, and autonomous transportation require real-time processing with minimal latency. To overcome these limitations, Edge Intelligence has emerged as an advanced computing paradigm.

Edge Intelligence combines edge computing and AI to process data near the edge devices instead of relying entirely on centralized cloud servers. This

architecture reduces latency, improves privacy, enhances reliability, and enables intelligent real-time services.

2. EDGE INTELLIGENCE OVERVIEW

Edge Intelligence refers to the deployment of AI algorithms and computing resources at the network edge, where data is generated. It enables intelligent processing directly on edge devices such as sensors, gateways, smartphones, cameras, and local servers.

Key Features of Edge Intelligence

- Real-time data processing
- Reduced communication latency
- Lower bandwidth consumption
- Enhanced data privacy and security
- Distributed intelligence
- Improved reliability and scalability

Need for Edge Intelligence in Smart Cities

Smart cities involve millions of interconnected devices generating continuous streams of data. Cloud-centric architectures cannot efficiently handle:

How to Cite:

Aadarsh Joshi & Madhuri Gupta (2026), Edge Intelligence Architecture for Smart City Applications: a Review Paper, International Educational Journal of Science & Engineering (IEJSE), Vol: 9, Special Issue, Aug 2026 22-26

- Massive IoT traffic
- Real-time analytics requirements
- Delay-sensitive applications
- Privacy-sensitive citizen data

Edge Intelligence addresses these issues by enabling local processing and decision-making.

3. ARCHITECTURE OF EDGE INTELLIGENCE FOR SMART CITIES

The Edge Intelligence architecture for smart city applications generally consists of multiple layers.

3.1 Device Layer

This layer includes IoT devices and sensors deployed throughout the city.

Components

- Smart sensors
- CCTV cameras
- Environmental monitoring devices
- Smart meters
- Wearable healthcare devices
- Autonomous vehicles

Functions

- Data collection
- Initial signal processing
- Local sensing

3.2 Edge Layer

The edge layer processes data close to the source.

Components

- Edge servers
- Edge gateways
- Fog nodes
- Micro data centers

Functions

- Real-time analytics
- AI inference
- Data filtering
- Temporary storage
- Local decision-making

This layer minimizes latency and reduces the amount of data transmitted to the cloud.

3.3 Network Layer

The network layer provides communication between edge devices and cloud systems.

Technologies Used

- 5G communication
- Wi-Fi
- LPWAN
- Software Defined Networking (SDN)
- Network Function Virtualization (NFV)

Functions

- Secure data transmission
- Resource management
- Network optimization

3.4 Cloud Layer

The cloud layer provides centralized processing and long-term storage.

Functions

- Large-scale data analytics
- AI model training
- Historical data storage
- Global resource management

Cloud systems support computationally intensive tasks that cannot be efficiently executed at the edge.

3.5 Application Layer

This layer provides smart city services to users and authorities.

Applications

- Smart transportation
- Smart healthcare
- Smart energy management
- Smart surveillance
- Waste management
- Smart agriculture
- Disaster management

4. ENABLING TECHNOLOGIES

4.1 Internet of Things (IoT)

IoT devices collect real-time data from the urban environment and act as the foundation of smart cities.

4.2 Artificial Intelligence and Machine Learning

AI algorithms analyze data and make intelligent

decisions for automation and optimization.

4.3 5G Networks

5G enables ultra-low latency, high-speed communication, and massive device connectivity.

4.4 Edge Computing

Edge computing moves computational resources closer to end devices for faster processing.

4.5 Big Data Analytics

Big data technologies handle large volumes of heterogeneous smart city data.

4.6 Blockchain

Blockchain enhances security, transparency, and trust in decentralized smart city systems.

5. SMART CITY APPLICATIONS OF EDGE INTELLIGENCE

5.1 Intelligent Transportation Systems

Edge Intelligence improves traffic monitoring, congestion control, and autonomous vehicle coordination.

Benefits

- Real-time traffic management
- Accident detection
- Smart parking systems
- Reduced travel time

5.2 Smart Healthcare

Healthcare systems use wearable sensors and edge AI for remote patient monitoring.

Benefits

- Real-time health monitoring
- Emergency detection
- Reduced hospital workload
- Faster medical response

5.3 Smart Energy Management

Edge Intelligence supports efficient energy distribution and smart grid management.

Benefits

- Energy optimization
- Fault detection
- Demand forecasting

- Reduced energy waste

5.4 Smart Surveillance and Public Safety

AI-enabled edge cameras improve urban security.

Features

- Facial recognition
- Intrusion detection
- Crowd monitoring
- Crime prevention

5.5 Environmental Monitoring

Sensors continuously monitor environmental conditions.

Parameters Monitored

- Air pollution
- Noise levels
- Water quality
- Weather conditions

5.6 Waste Management

Smart bins equipped with sensors optimize waste collection processes.

Advantages

- Efficient route planning
- Reduced operational costs
- Improved cleanliness

6. ADVANTAGES OF EDGE INTELLIGENCE IN SMART CITIES

Reduced Latency

Data is processed near the source, enabling faster response times.

Bandwidth Optimization

Only relevant data is transmitted to cloud servers, reducing network congestion.

Improved Privacy

Sensitive citizen data can remain locally processed.

Scalability

Distributed architecture supports large-scale smart city deployments.

Reliability

Local processing ensures service continuity even

during network failures.

Energy Efficiency

Optimized communication and local computation reduce energy consumption.

7. CHALLENGES AND LIMITATIONS

Resource Constraints

Edge devices have limited storage, processing power, and battery capacity.

Security and Privacy Issues

Distributed systems increase vulnerability to cyberattacks.

Heterogeneity

Smart city devices use different hardware platforms and communication protocols.

AI Model Management

Deploying and updating AI models across edge devices is complex.

Data Management

Managing massive real-time data streams remains challenging.

Interoperability

Integration among different smart city systems is difficult.

8. FUTURE RESEARCH DIRECTIONS

Federated Learning

Federated learning enables distributed AI training without sharing raw data, enhancing privacy.

Edge-Cloud Collaboration

Efficient coordination between edge and cloud systems can improve performance.

Green Edge Computing

Energy-efficient EI architectures are required for sustainable smart cities.

AI Model Optimization

Lightweight AI models suitable for resource-constrained devices are needed.

Blockchain-based Security

Blockchain can improve trust and security in decentralized environments.

Quantum Edge Intelligence

Future research may integrate quantum computing with edge intelligence for high-speed processing.

9. COMPARATIVE ANALYSIS OF CLOUD COMPUTING AND EDGE INTELLIGENCE

Feature	Cloud Computing	Edge Intelligence
Processing Location	Centralized Cloud	Near Data Source
Latency	High	Low
Bandwidth Usage	High	Reduced
Real-Time Support	Limited	Excellent
Privacy	Lower	Better
Scalability	Moderate	High
Reliability	Network Dependent	More Reliable

10. CONCLUSION

Edge Intelligence has emerged as a transformative technology for smart city applications. By integrating AI with edge computing, it enables low-latency, intelligent, and secure services for urban environments. The architecture supports real-time analytics, efficient resource utilization, and enhanced citizen services across various domains including transportation, healthcare, energy, surveillance, and environmental monitoring.

Despite several advantages, challenges such as security, interoperability, resource limitations, and AI model management still require further research. Future advancements in federated learning, 5G/6G networks, blockchain, and green computing will further enhance the capabilities of Edge Intelligence systems. Therefore, Edge Intelligence is expected to play a critical role in the development of sustainable, efficient, and intelligent smart cities in the coming years.
